 The present sequence is a linear stretch of amino acids (present in fibronectin) recognised by the integrin alpha4betal. Integrins are fibronectin) recognised by the integrin alpha4betal. Integrins are receptors. The penton base protein (one of the coat proteins) of adenoviruses binds to integrins. The integrins not only proteins of adenoviruses binds to the extracellular matrix molecules. The specification describes a method of introducing an adenovirus into a cell in vitro having a particular cell surface binding site. The adenovirus is contacted with a bispecific molecule comprising a component that selectively binds a binding domain of the penton base protein of the adenovirus and a second component that selectively binds the cell surface binding site. A complex of the adenovirus and the bispecific molecule is formed, and the cell is contacted with it to allow entry of the adenovirus into the cell is the methods can be used for research and the

The invention relates to integrin ligand dissociators. Disaggregation of an existing platelet thrombus in a blood vessel is due to dissociation of fibrinogen from glycoprotein Inb-IIIa. This dissociation is caused by the binding of an integrin-ligand dissociator at ligand binding site I of glycoprotein IIb-IIIa. The invention provides a method of disaggregating of an existing platelet thrombus in a blood vessel, where the platelet transmission of a blood vessel, an a subject comprises administering a compound which dissociates fibrinogen bound to a first constraint of the method is used to treat humans with unstable contraints. The method is used to treat humans with unstable congine and/or caute mycoardial infarction. The methods can be used to enact de-adhesion of osteoloasts from the bone surface to halt cond to a patient with osteoporosis. The methods can also be used to reat tumours, condition associated with and/openesis, e.g. cancer, diabbtic retinopathy, psoriasis. Inflammatory conditions, e.g. arthritas, inflammatory conditions, e.g. arthritas, inflammatory conditions, e.g. arthritas, inflammatory conditions, e.g. arthritas, inflammatory conditions, e.g. arthritas, inflammatory conditions, e.g. arthritas, inflammatory conditions, e.g. arthritas, inflammatory conditions, e.g. arthritas, inflammatory conditions, e.g. arthritas, inflammatory conditions, e.g. arthritas, inflammatory conditions, e.g. arthritas, inflammatory conditions, e.g. arthritas, inflammatory conditions, e.g. arthritas, inflammatory conditions, e.g. arthritas, inflammatory conditions, e.g. arthritas, inflammatory conditions, e.g. arthritas, inflammatory conditions, e.g. arthritas, inflammatory conditions, e.g. arthritas, inflammatory conditions, e.g. arthritas, inflammatory departure from the current strategy of treatment prior to formation of percent conditions of percent constant any encourse any entered to treat the encours.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

Huyghe BG,

```
The invention relates to peptidomimetic compounds (AAY77415-Y77438)

Capable of inhibiting the binding of the VLA-4 integrin (alpha-4-beta-1, CC Cap494(CD29) to the CS-1 portion (25 amino acids) of a splice variant of the extracellular matrix protein fibronectin (FW). VLA-4 is expressed on the extracellular matrix protein fibronectin (FW). VLA-4 is expressed on the extracellular matrix protein fibronectin (FW). VLA-4 is expressed on the extracellular matrix protein fibronectin (FW). VLA-4 is expressed on the maturation and trafficking. VLA-4-mediated

CC important role in the maturation and trafficking. VLA-4-mediated

CC important role in the maturation and trafficking. VLA-4-mediated

CC critical step in the inflammatory response. The peptidomimetics of the invention may be used to treat both chronic and acute immunoinflammatory condition, demyelinating diseases of the central nervous system callograft rejection. They may also be used to treat psoriasis and other skin inflammatory bowel disease, kidney inflammation and castlon at inhibition of VLA-4(CS-1 interaction either involves the use of anti-VLA-4 antibodies, which can themselves induce an immonia response on repeated administration, or the 25-mer CS-1 peptide, which is large and costly to make and is subject to rapid proteolytic degradation. The peptidomimetics of the invention are smaller in CC comparison to the CS-1 peptide and therefore lass expensive to comparison to the CS-1 peptide and therefore lass expensive to comparison to the CS-1 peptide to imminiate to immobilised CS-1 peptide for their ability to inhibit VLA-4 Jurkat cells to immobilised CS-1 peptide for lax-714.00
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New peptidomimetic compounds used as cell surface fibronectin expressing receptor and VLA-4 inhibitors for treating inflammatory and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     LDV peptide; VLA-4 inhibitor; very late antigen; alpha-4-beta-1; CD49d/CD29; cell adhesion; arylalkyl azolylalkanoic acid derivative; arylureidoalkyl azolylalkanoic acid derivative; inflammatory disorder; autoimmune disorder; respiratory disorder; LDV motif.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             100.0%; Score 23; DB 21; Length 5; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a novel system for reconstitution of ossecus tissue comprising a scaffold carrying a compound (1) that promotes bone formation and a component that decreases bone resorption (II).

(II) induces migration and adhesion of osteoblasts and osteoclasts and (II) inhibite proteolysis (specifically by plasmin) of extracellular matrix. (I) is preferably selected from: selectin or selectin binding ragments, proteins and peptides that facilitate cell adhesion, plasminogen activator inhibitors. Protease inhibitors and metalloprotease inhibitors are claimed examines of cell adhesion peptides used in the system of the invention. The system is used to replace, remodel or correct bone defects, e.g. fractures, fissures or bone mass loss. Incorporation of (I) into the cafficld results in rapid seeding by osteoblasts and the development of an organic matrix, i.e. the preformed scaffold replaces the rate-determining step of extracellular matrix formation. The scaffold can be designed to have a predetermined resorption/degradation rate, and may include the component of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Fibronectin, FN; CS-1; endothelial cell; VLA-4 integrin; alpha-4-beta-1; CD494/CD29; leukocyte; inflammatory cell; inflammation; cell adhesion; inhibitor; peptidomimetic; autoimmune disease; inflammatory disorder.

The invention relates to a method for treating a mammal with, or at risk of developing, chronic renal failure, involving the administration of at least one integrin antagonist. The integrin antagonists that may be used in the method include antagonists of alpha-1-subunit containing integrins or antagonists of alpha-1-subunit containing integrins. In particular, the antagonists are antibodies specific for VLA-1 (very late antigen.), alpha-1-beta-1 integrin) or VLA-4 (alpha-4-beta-1 integrin) which inhibit the interaction of the integrin and tis cognate ligand (collagen IV, and laminin in the case of VLA-1, and fibronectin and VCAM-1 in the case of VLA-4). The method of the invention may be used to treat chronic renal failure, end-stage renal disease, chronic diabetic nephropathy, diabetic collagens of propertensive glomerulosclarosis, chronic glomerulonephritis, hereditary nephritis or renal dysplasia. Sequences AAB73464-AAB73466 represent fibronectin, which inhibit fibronectin-dependent call adhesion, and may therefore be used in the method of the invention.
                                                                                                                                                                                                                            Treating a mammal in, or at a risk of developing, chronic renal failure, involves administering at least one integrin antagonist to the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Protection; endogenous therapeutic peptide; peptidase; conjugation; blood component; modification; succinimidyl; maleimido group; amino; hydroxyl; thiol; hormone; growth factor; neurotransmitter.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Fibronectin fragment and fibrin related peptide SEQ ID NO:1142

                                                                                                                                                                                                                                                                                                                                                                                                                                                                             acolylalkanoic acid derivatives and related compounds (1), and their sales and prodrugs. These are are integrin inhibitors, specifically of NLA-4 (very late antigen 4, also known as alpha-4-beta-1 or CD494/CD29), which mediate cell adhesion. VLA-4 is a receptor for the cytckine-inducible cell surface protein VCAM-1 (vascular cell adhesion molecule-1) and for the alternatively spliced forms of fibronectin (FN) which contain the CS-1 domain. The novel compounds inhibit cell adhesion, and consequent or associated pathogenic processes mediated by VLA-4, and may therefore be useful in the treatment and prevention of inflammatory, autoimmune, or respiratory disorders. These include asthma, arthritis, psoriasis, multiple sclerosis, transplant rejection, diabetes, and can indiane the VLA-4-binding domain of the FN CS-1 region which contain the LDV motif and are known to inhibit fibronectin-dependent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes a modified therapeutic peptide (I) comprising a therapeutically active amino acid region (III) and a reactive group (II) (e.g. succiningly and maleimide groups) attached to a less therapeutically active amino acid region (IV), which covalently bonds with amino/hydroxyl/thiol groups on blood components to form a peptidase stabilised therapeutic peptide components to form a competidase stabilised therapeutic peptide components to form a peptidase stabilised therapeutic peptides of 3-50 amino acids. (I) are useful for modifying therapeutic peptides e.g. hormones, growth factors and neurotransmitters, to protect them from peptidase activity in vivo for the treatment of various disorders. Endogenous therapeutic peptides are not suitable as drug candidates as they require frequent administration due to rapid degradation by peptidases in the body. Modifying and attaching therapeutic peptides to albumin prevents or reduces the action of peptidases to increase length of activity (half life) and specificity as bonding to large molecules decreases intracellular upcake and interference with physiological processes. AABB90829 to AABB941 represent peptides which can be used in the
                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                       Modifying and attaching therapeutic peptides to albumin prevents peptidase degradation, useful for increasing length of in vivo activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Bolypeptides useful in construction of structural models for identifying therapeutic compounds, comprises series of heptad repeats
                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Integrin; transmembrane protein; alpha4 integrin inhibitor; paxillin; immunosuppressive; inflammatory bowel disease; arthritis; multiple sclerosis; asthma; atherosclerosis; wound healing.

The present sequence is given in a specification relating to a polypeptide comprising a series of heptad-repeats that mimic a transmembrane domain, and a selected cytoplasmic domain attached to the putpad repeats. At least a portion of the polypeptide is prepared recombinantly or at least 1 heptad repeat in the series has a different amino acid sequence to other heptad repeats in the series. The control of structural models which are useful for evaluating structure and activity of a selected occupied and clustered transmembrane protein having the selected cytoplasmic domain and for identifying therapeutic compounds. It is also useful for and for identifying therapeutic compounds. It is also useful for and for identifying the structural model with paxillin or a paxillin related molecule in the presence and absence of a test agent paxillin related molecule in the presence and absence of the test and determining binding of paxillin related molecule to the structural model. A decrease in binding in the presence of the test agent indicates that the test agent is an inhibitor of alpha4 integrin blocking immune responses in conditions such as inflammatory bowel disease, arthritis, multiple sclerosis and asthma and in inhibiting atherosclerosis and scarring during wound healing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   identifying therapeutic compounds, comprises series of heptad repeats that mimic a transmembrane domain and cytoplasmic domain attached to

The invention relates to peptidomimetic compounds (AAY77415-Y77438) capable of inhibiting the binding of the VLA-4 integrin (alpha-4-beta-1, CD49d/CD29) to the CS-1 portion (25 amino acids) of a splice variant of the extracellular matrix protein fibronectin (FN). VLA-4 is expressed on the extracellular matrix protein fibronectin (FN). VLA-4 is expressed on important role in the maturation and trafficking. VLA-4-mediated leukocyte adhesion to the CS-1 FN/VLA-4 interaction plays an important role in the maturation and trafficking. VLA-4-mediated leukocyte adhesion to the CS-1 FN/VLA-4 interaction plays and runcortion may be used to treat both chronic and acute immunoinflammatory conditions, such as asthma, rheumatoid arthritis, osteoarthritis and allograft rejection. They may also be used to treat psoriasis and other skin inflammations, demyelinating diseases of the central nervous system (e.g., multiple sclerosis), allergies, atherosclerosis, colitis, cliabetes, inflammatory bowel disease, kidney inflammation and
                                                                                                                                                                                                                                                                                                                 ô

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New peptidomimetic compounds used as cell surface fibronectin expressing receptor and VLA-4 inhibitors for treating inflammatory and cardiovascular disorders
                                                                                                                                                                                                                                                                                                               Gaps
The present invention relates to a peptide with a series of heptad-repeats that mimic a transmembrane domain and a selected cytoplasmic domain attached to the heptad respeats. The invention is useful for evaluating structure and activity of a selected occupied and clustered transmembrane protein with the selected cytoplasmic domain and for identifying therapeutic compounds. It is also useful for identifying a cytoplasmic domain binding partner. It is may be used to study protein interactions with transmembrane proteins such as integrin, which can be used to treat conditions in which over activity of integrins is involved, such as inflammation,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Chen PG;

The invention relates to peptidomimetic compounds (AAY77415-Y77438) capable of inhibiting the binding of the VLA-4 integrin (alpha-4-beta-1, CD49d/CD29) to the CS-1 portion (25 amino acids) of a splice variant of the extracellular matrix protein fibronectin (FW). VLA-4 is expressed on the surface of leukocytes; the CS-1 FW/VLA-4 interaction plays an important role in the maturation and trafficking. VLA-4-mediated important role in the maturation and trafficking. VLA-4-mediated clucyte adhesion to the CS-1 FW/VLA-4 interaction plays an elukocyte adhesion to the CS-1 FW of endothelial cells is also a critical step in the inflammatory response. The peptidomimetics of the cinvention may be used to treat both chronic and acute immunoinflammatory conditions, such as asthma, rheumatoid arthritis, osteoarthritis and allograft rejection. They may also be used to treat pooriasis and other skin inflammations, demyelinating diseases of the central nervous system (e.g., multiple sclerosis), allergies, atherosclerosis, colitis, diabetes, inflammatory bowel disease, kidney inflammation and creation either
                                                                                                                                                                                                                                                                                                                 ö
restenosis. Prior art inhibition of VLA-4/CS-1 interaction either involves the use of anti-VLA-4 antibodies, which can themselves induce an immune response on repeated administration, or the 25-mer CS-1 peptide, which is large and costly to make and is subject to rapid proteolytic degradation. The peptidomimetics of the invention are smaller in comparison to the CS-1 peptide and therefore less expensive to manufacture, and are resistant to proteolysis. Sequences AAY77411-Y77414 and AAY77434-Y77444 represent fragments of the CS-1 peptide tested for their ability to inhibit VLA-4 Jurkat cells to immobilised CS-1 peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Fibronectin; FN; CS-1; endothelial cell; VLA-4 integrin; alpha-4-beta-1; CD49d/CD29; leukocyte; inflammatory cell; inflammation; cell adhesion; inhibitor; peptidomimetic; autoimmune disease; inflammatory disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New peptidomimetic compounds used as cell surface fibronectin expressing receptor and VLA-4 inhibitors for treating inflammatory and cardiovascular disorders
                                                                                                                                                                                                                                                                                                                 Gaps

involves the use of anti-VLA-4 antibodies, which can themselves induce ar immune response on repeated administration, or the 25-mer CS-1 peptide, which is large and costly to make and is subject to rapid proteolytic degradation. The peptidomimetics of the invention are smaller in comparison to the CS-1 peptide and therefore less expensive to an anulacture, and are resistant to proteolysis. Sequences AAY77411-Y77414 and AX77434-X77444 represent fragments of the CS-1 peptide tested for their ability to inhibit VLA-4 Jurkat cells to immobilised CS-1 peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence represents an alpha4 integrins targeting sequence, which is used in an example from the present invention. The present invention describes a chimeric adenovirus fibre protein (AFP) containing a constrained non-native amino acid sequence. The non-native amino acid sequence allows the chimeric fibre (or a vector comprising the chimeric fibre) to more efficiently bind to and enter cells. The products can be used for gene therapy, for treating cancer, e.g. melanoma, glioma and lung cancers as well as genetic disorders, e.g. vestic fibrosis, haemophilia and muscular dystrophy as well as pathogenic infections, e.g. HIV, tuberculosis and hepatitis and also for heart disease, to e.g. prevent restenosis following angioplasty or to promote angiogenesis to reperfuse necrotic tissue, and in autoimmune disorders, e.g. Crohn's disease, colitis, rheumatoid arthritis, and Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Chimeric; adenovirus; fiber protein; binding; targeting; coat protein; constrained peptide motif; gene therapy; cancer; heart disease; autoimmune disorder.
                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Chimeric adenovirus fibre proteins - containing non-native amino acid sequence to provide for binding and entry into cells, especially for gene therapy
                                                                                                                                                                                                                                                         ö

                                                                                                                                                                                                                                                                                                                                                                                                                          The peptide is derived the CS-1 peptide (Humphries et al., 1987, J. Biol. Chem. 262:6886-6892), from the IIICS variable region of fibronectin. The peptide inhibits binding of lymphocytes to endothelial cells preventing migration through the vascular endothelium and into tissues. It acts by blocking the alphabetal extracellular matrix receptor. Admin. of the peptide can suppress the immune response and treat diseases associated with chronic or relapsing activation of the immune system, including collagen vascular diseases and other autoimmune diseases, multiple sclerosis, asthma, allergy and chronic inflammatory skin
                                                                                                                                                                                                                                                                                                                                                 Inhibition of lymphocyte adherence to vascular endothelium - using a novel antibody or peptide for treatment of auto-immune disease, asthma, allergy etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to new propenamide compounds of formula RIR2C=C(R3)CO-(NH)x-A and their (optionally crosslinked) polymers, where R1 and R2 are H or COOH, R3 = H, Me, Et, halo or carboxymethyl, A is a peptide of formula -(R4)x-(CO)x-(G1U)x-(IL8)x-Leu-App-Val-(Pro)x-(Ser)x-(Thr)Xin-(Z)x-(R5)x-, where Z = 0 or NH, one of R4 and R5 is a terminal H and the other is absent or 1-11C alkylene or 6-11C arylene each of which may be optionally substituted, n = 1 - 5, and x = 0 or 1. The compounds and their polymers combine with cell surface receptors and prevent cell adhesion. They can be used to inhibit cancer metastasis and to activate lymphocytes, and as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                    New propenamide cpds. which are N-substd. by specified peptide, and new polymers - are cell adhesion inhibitors useful e.g. for preventing cancer metastasis

AAW25187-W25192 are peptides containing an LDV sequence or equivalent. The peptides are capable of binding to cell adhesion molecules and are used in aqueous irrigation solutions for use during and after endoscopic operations. Preferred irrigation solutions are electrolyte-free and contain 1 microg/ml to 100 mg/ml of one or more oligopeptides containing the amino acid sequences: RGD, LDV, IDA, DGEA, GPRP, VTL, YIGSR, KQAGDV and/or REDV (given in one letter amino acid acide). The solutions are especially used for irrigating the bladder during and after tumour removal by transurethral resection. The peptides protect against recurrence of tumours.
                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Peptides AAW63133-34 appear in the specification, which describes non-viral mediated methods for incorporating a macromolecule into a cell. The methods and products permit the immobilisation, microinjection and recovery of cells. The methods can be used for introducing genetic material, proteins, peptides and immunoglobulins into living cells. In partial, they can be used in gene therapy for the treatment of disorders such as thalassemia and cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

                                                                                                                                                                                                    AAR92536-R92555 represents VLA-4 binding peptides derived from the antibody 21/6. VLA-4 is also known as alpha4betal integrin and catiody 21/6. VLA-4 binds to the non-matrix molecule VCAM-1, which is expressed by which is also known as alpha4betal integrin and expressed by endothelial and other cells. These sequences mimic a short consensus sequence in the heavy chain complementarity determining region (CDR) 3 of monoclonal antibodies against alpha4betal integrin. These sequences inhibit the adhesion of leucocytes mediated by VLA-4. It is useful for treating inflammatory brain disorders (especially multiple sclerosis), meningitis, encephalitis, asthma, Alzheimer's disease, rheumatoid arthritis, transplant rejection, tumour metastsass and myocardial ischaemia. These sequences can also be labelled, and can then myocardial ischaemia. These sequences can also be labelled, and can then the used for in vivo or in vitro diagnosis, such as monitoring inflammatory responses, isolating elecocytes, in assasys for inhibitors of VLA-4/VCAM-1 interactions and imaging sites of inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ô

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence represents a specifically claimed non-native amino acid sequence from a chimeric adenovirus fibre protein (AFP) of the present invention. The non-native amino acid sequence allows the chimeric fibre (or a vector comprising the chimeric fibre) to more efficiently bind to and enter cells. The products can be used for gene farrangy. For trearing cancer, e.g. melanoma, glioma and lung cancers as well as genetic disorders, e.g. cystic fibrosis, haemophilia and muscular dystrophy as well as pathogenic infections, e.g. HIV, truberculosis and hepatitis and also for heart disease, to e.g. prevent restenosis following angioplasty or to promote angiogenesis to reperfuse necrotic tissue, and in autoimmune disorders, e.g. Crohn's disease, colitis, rheumatoid arthritis, and Alzheimer's disease.
                                                                                                                             Chimeric; adenovirus; fiber protein; binding; targeting; coat protein; constrained peptide motif; gene therapy; cancer; heart disease; autoimmune disorder.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This sequence represents a fibronectin protein fragment used in the extracellular matrix (A) of the invention. (A) is used for promoting wound healing, and comprises a recombinant fibronectin peptide, containing peptide fragments from at least two fibronectin domains, and a backbone matrix. The fibronectin domain peptides used are preferably from the IIICS domain, the cell binding domain, or the heparin II binding domain of human fibronectin. (A) provides hasmostasis and an environment that recruits new tissue cells to the site of the wound. (A) is used to promote healing of acute or chronic wounds, e.g. surgical incisional wounds, traumatic wounds, radiation wounds, cancer extirpations, venous leg ulcers, diabetic ulcers and pressure ulcers.
Fibronectin, extracellular matrix; wound healing promoter; IIICS domain; cell binding domain; heparin II binding domain; haemostasis; therapy; surgical incisional wound; traumatic wound; radiation wound; cancer extirpation; venous leg ulcer; diabetic ulcer; pressure ulcer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Fibronectin; extracellular matrix. open wound healing; IIICS domain; acute gaping cutaneous wound; chronic cutaneous ulcer; therapy; wound healing promoter; cell binding domain; heparin II binding domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                            ద
                                                                                                                                                  This sequence represents a fibronectin protein fragment used in the extracellular matrix of the invention. The extracellular matrix comprises two or more fibronectin domains in a backbone matrix, and is used to enhance wound healing. The fibronectin domain peptides used are preferably from the IIICS domain, the cell binding domain, or the heparin II binding domain of human fibronectin. The matrix facilitates wound healing by providing an environment that intrinsically recruits new tissue cells to the wound site. The new matrix is useful for facilitating wound healing, especially useful for treating open wounds such as acute gaping cutaneous wounds and chronic cutaneous ulcers. The problem of chronic, non-healing wounds is severe. These open wounds require long-term care and procedures that are costly and labour intensive.

The prior compositions and matrices have not been useful or cost effective. The present invention provides a matrix for wound healing that meets these requirements, and overcomes the deficiencies of the

This invention relates to a pharmaceutical composition used for gene therapy, comprising a nucleic acid encoding a therapeutic gene and a promoter, a transfection vehicle and an agent to disrupt the function of the junctional complex in the cells. The pharmaceutical composition of cytostatic, cardiant, vasotropic, antiinflammatory and antilipaemic activity. The pharmaceutical composition is useful for gene therapy and for enhancing efficiency of gene delivery to cells. The composition is useful for gene therapy of cytic fibrosis, inflammatory or fibrotic lung diseases, peripheral vascular disease, coronary arterial diseases, restensis, hypercholesterolaemia and cancer. The present sequence represents a vitronectin peptide. The peptide can be used to enhance the binding affinity of a viral vector used in the pharmaceutical
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        System for reconstructing osseous tissue, useful e.g. for treating fractures, comprises scaffold containing promoter of bone formation and

bone formation and a component that decreases bone resorption (II).

Li inhibite sugration and adhesion of osteoblasts and osteoclasts and (II) inhibites proteolysis (specifically by plasmin) of extracellular matrix. (I) is preferably selected from: selectin or selectin binding fragments, proteins and peptides that facilitate cell adhesion, plasminogen activator inhibitors, protease inhibitors and metalloprocease inhibitors. Pre peptides AAY8046-Y80492 are claimed metalloprocease inhibitors peptides used in the system of the invention. The system is used to replace, remodel or correct bone defects, e.g. fractures, fissures or bone mass loss: Incorporation of (I) into the scaffold results in rapid seeding by osteoblasts and the development of an organic matrix, i.e. the preformed scaffold replaces the rate-determining step of extracellular matrix formation. The scaffold can be designed to have a predetermined resorption/degradation rate, and may
                      ention relates to a novel system for reconstitution of ossecomprising a scaffold carrying a compound (1) that promotes
                                                                                                                                                                                                                                                                                                                                                                                                          include regulatory compounds for specific cell types.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Conservative

Arylalkyl and arylureidoalkyl azolylalkanoic acid derivatives

Disclosure; Page 2; 120pp; English.

The invention relates to novel arylalkyl and arylureidoalkyl azolylalkanoic acid derivatives and related compounds (I), and their salts and prodrugs. These are are integrin inhibitors, specifically of VLA-4 (very late antigen 4, also known as alpha-4-beta-1 or CD49d/CD29), which mediate cell adhesion. VLA-4 is a receptor for the cytokinemidicable cell aurface protein VCA+1 is a veceptor for the cytokinemolecule-1) and for the alternatively spliced forms of fibronectin (FN) which contain the CS-1 domain. The novel compounds inhibit cell adhesion,

The integrin antagonists that may be used in the method include antagonists of alpha-4-subunit containing integrins or antagonists are antibodies specific for VLA-1 (very late antigon-1, alpha-1-beta-1 integrin) or VLA-4 (alpha-4-beta-1 integrin) which inhibit the interaction of the integrin and its cognate ligand (collagen I, collagen IV, and lamini in the case of VLA-1, and fibronectin and VCAM-1 in the case of VLA-4). The method of the invention may be used to treat chronic renal failure, end-stage renal disease, chronic diabetic nephropathy, diabetic
and consequent or associated pathogenic processes mediated by VLA-4, and way therefore be useful in the treatment and prevention of inflammatory, autoimmune, or respiratory decoders. These include asthma, arthritis, psoriasis, multiple sclerosis, transplant rejection, diabetes, and inflammatory bowel disease. Sequences APK5918-Y5520 respresent poptides derived from the VLA-4-binding domain of the FN CS-1 region which contain the LDV motif and are known to inhibit fibronectin-dependent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Treating a mammal in, or at a risk of developing, chronic renal failure, involves administering at least one integrin antagonist to the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 2XXX5X
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes a modified therapeutic peptide (I) comprising a therapeutically active amino acid region (III) and a reactive group (II) (e.g. succinimidyl and maleimido groups) attended to a less therapeutically active amino acid region (IV), which covalently bonds with amino/hydroxyl/thiol groups on blood components to form a peptidase stabilised therapeutic peptide composed of 3-50 amino acids. (I) are useful for modifying therapeutic peptides of 3-50 amino acids. (I) are useful for modifying therapeutic peptides of 3-50 amino acids. (I) are useful for modifying therapeutic peptides of the peptidase activity in vivo for the treatment of various disorders. Endogenous therapeutic peptides are not suitable as drug candidates as they require frequent administration due to rapid degradation by peptidases in the body. Modifying and attaching therapeutic peptides to albumin prevents or reduces the action of peptidases to increase length of activity (half life) and specificity as bonding to large molecules decreases intracellular upcake and interference with physiological processes. AAB90829 to AAB92441 represent peptides which can be used in the
                                                                                                                                                        o;
glomerulopathy, diabetic renal hypertrophy, hypertensive nephrosclerosis, hypertensive glomerulosclerosis, chronic glomerulonephritis, hereditary nephritis or renal dysplasia. Sequences AAB73464-AAB73466 represent peptides derived from the VLA-4 binding domain (CS-1 region) of fibronectin, which inhibit fibronectin-dependent cell adhesion, and may therefore be used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Modifying and attaching therapeutic peptides to albumin prevents peptidase degradation, useful for increasing length of in vivo activity

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            a 2,4,6-trisubstituted s-triazine ring, where one substitution is a polyethylene glycol chain (CH3 (CH2CH2))-0- (in=1-150)] and the other is either another, same, polyethylene glycol chain, or another, same, peptide chain. These PEG derivates or their salts are useful as animal cell adhesion inhibitors, or as platelet agglutination or adhesion inhibitors. They may also be used as carcinoma metastasis inhibitors, wound healing drugs and immunoregulators.

The invention relates to peptidomimetic compounds (AAY77415-Y77438) capable of inhibiting the binding of the VLA-4 integrin (alpha-4-beta-1, CD494/CD99) to the CS-1 portion (55 amino acids) of a splice variant of the extracellular matrix protein fibronectin (FN). VLA-4 is expressed on the surface of leukocytes; the CS-1 FN/VLA-4 interaction plays an important role in the maturation and trafficking. VLA-4-mediated leukocyte adhesion to the CS-1 FN of endothelial cells is also a critical step in the inflammatory response. The peptidomimetics of the invention may be used to treat both chronic and acute immunoinflammatory conditions, such as sathma, rheumatoid arthritis is osteoarthritis and allograft rejection. They may also be used to treat pooriaals and other skin inflammations, demyelinating diseases of the central nervous system
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Fibronectin, FN; CS-1; endothelial cell; VLA-4 integrin; alpha-4-beta-1; CD49d/CD29; leukocyte; inflammatory cell; inflammation; cell adhesion; inhibitor; peptidomimetic; autoimmune disease; inflammatory disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New peptidomimetic compounds used as cell surface fibronectin expressing receptor and VLA-4 inhibitors for treating inflammatory and cardiovascular disorders
                                                                                                                                                The sequences given in AAR28885-86 are peptides which have been shown to inhibit cell adhesion. These peptides can be used as the active component in a cancer metaeris inhibitor, a wound healer, an immunosuppressant, a platelet aggregation inhibitor or a neuropathy
                                                    Peptide deriv. - useful as cancer metastasis inhibitor, wound healer, immunosuppressant, etc.
                                                                                                                                                                                                                                                                                                                                     Indels
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Huyghe BG,

(e.g., multiple sclerosis), allergies, atherosclerosis, colitis, diabetes, inflammatory bowel dieease, kidney inflammation and restenosis. Prior art inhibition of VLA-4CS-1 interaction either involves the use of anti-VTA-4 antibodies, which can themselves induce an immune response on repeated administration, or the 25-mer CS-1 peptide, which is large and costly to make and is subject to rapid proteolytic degradation. The peptidemineties of the invention are smaller in comparison to the CS-1 peptide and therefore less expensive to and are resistent to proteolysis. Sequences AA77141-Y77414 and AA77444 represent fragments of the CS-1 peptide tested for their ability to inhibit VLA-4 Jurkat cells to immobilised CS-1 peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to peptidomimetic compounds (AAY77415-Y77438) capable of inhibiting the binding of the VLA-4 integrin (alpha-4-beta-1, CD494/CD29) to the CS-1 portion (25 amino acids) of a splice variant of the extracellular matrix protein fibromectin (FN) vLA-4 is expressed on the surface of leukocytes; the CS-1 FN/VLA-4 interaction plays an important role in the maturation and trafficking vLA-4-mediated leukocyte adhesion to the CS-1 FN of endothelial cells is also a critical step in the inflammatory response. The peptidomimetics of the invention may be used to treat both chronic and acute immunoinflammatory conditions, such as asthma, rheumatoid arthritis, osteoarthritis and allograft rejection. They may also be used to treat psoriasis and other skin inflammations, demyeliating diseases of the central nervous system (e.g., multiple sclerosis), allergies, atherosclerosis, colitis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Fibronectin, FN; CS-1; endothelial cell; VLA-4 integrin; alpha-4-beta-1; CD49d/CD29; leukocyte; inflammatory cell; inflammation; cell adhesion; inhibitor; peptidomimetic; autoimmune disease; inflammatory disorder.

diabetes, inflammatory bowel disease, kidney inflammation and restenosis. Prior art inhibition of VLA-4/CS-1 interaction either involves the use of anti-VLA-4 antibodies, which can themselves induce an immune response on repeated administration, or the 25-mer CS-1 peptide, which is large and costly to make and is subject to rapid proteolytic degradation. The peptidomimetics of the invention are smaller in comparison to the CS-1 peptide and therefore less expensive to manufacture, and are resistant to proteolysis. Sequences AAY7411-Y77414 and AAY77434-Y77444 represent fragments of the CS-1 peptide tested for their ability to inhibit VLA-4 Jurkat cells to immobilised CS-1 peptide

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to peptidomimetic compounds (AAY77415-Y77438) capable of inhibiting the binding of the VLA-4 integrin (alpha-4-beta-1, CD494/CD29) to the CS-1 portion (55 amino acids) of a splice variant of the extracelular matrix protein fibronectin (FN). VLA-4 is expressed on important role in the maturation and trafficking VLA-4-mediated leukocyte adhesion to tec CS-1 FN/VLA-4 interaction plays an important role in the maturation and trafficking VLA-4-mediated leukocyte adhesion to the CS-1 FN of endothelial cells is also a critical step in the inflammatory response. The peptidomimetics of the invention may be used to treat both chronic and acute immunoinflammatory conditions, such as asthma, rheumatoid arthritis, osteoarthritis and allograft rejection. They may also be used to treat psoriasis and other skin inflammations, demyedlinating diseases of the central nervous system (e.g., multiple sclerosis), allergies, atherosclerosis, collitis, diabetes, inflammation and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Fibronectin, FN; CS-1; endothelial cell; VLA-4 integrin; alpha-4-beta-1; CD49d/CD29; leukocyte; inflammatory cell; inflammation; cell adhesion; inhibitor; peptidomimetic; autoimmune disease; inflammatory disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New peptidomimetic compounds used as cell surface fibronectin expressing receptor and VLA-4 inhibitors for treating inflammatory and cardiovascular disorders

restenosis. Prior art inhibition of VLA-4/CS-1 interaction either involves the use of anti-VLA-4 antibodies, which can themselves induce an immune response on repeated administration, or the 25-mer CS-1 peptide, which is large and costly to make and is subject to rapid proteolytic degradation. The peptidomimetics of the invention are smaller in comparison to the CS-1 peptide and therefore less expensive to manufacture, and are resistant to proteolysis. Sequences AAX77411-Y77414 and AAX77434-Y77444 represent fragments of the CS-1 peptide tested for their ability to inhibit VLA-4 Jurkat cells to immobilised CS-1 peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to peptidomimetic compounds (AAY77415-Y77438) capable of inhibiting the binding of the VLA-4 integrin (alpha-4-beta-1, CD494/CD39) to the CS-1 portion (25 amino acids) of a splice variant of the extracellular matrix protein fibromectin (FN). VLA-4 is expressed on the surface of leukocytes; the CS-1 FN/VLA-4 interaction plays an important role in the maturation and trafficking. VLA-4-mediated leukocyte adhesion to the CS-1 FN of endothelial cells is also a critical step in the inflammatory response. The peptidomimetics of the invention may be used to treat both chronic and acute immunoinflammatory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Fibronectin, FN; CS-1; endothelial cell; VLA-4 integrin; alpha-4-beta-1; CD49d/CD29; leukocyte; inflammatory cell; inflammation; cell adhesion; inhibitor; peptidomimetic; autoimmune disease; inflammatory disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             conditions, such as asthma, rheumatoid arthritis, osteoarthritis and allograft rejection. They may also be used to treat psoriasis and other skin inflammations, demyelinating diseases of the central nervous system (e.g., multiple sclerosis), allergies, atherosclerosis, colitis, diabetes, inflammatory bowel disease, kidney inflammation and restenosis. Prior art inhibition of VLA-4/CS-1 interaction either

ö
involves the use of anti-VLA-4 antibodies, which can themselves induce an immune response on repeated administration, or the 25-mer CS-1 peptide, which is large and costly to make and is subject to rapid proteolytic degradation. The peptidomimetics of the invention are smaller in comparison to the CS-1 peptide and therefore less expensive to manufacture, and are resistent to proteolytis. Sequences AAY7141-Y77414 and AAY77434-Y77444 represent fragments of the CS-1 peptide tested for their ability to inhibit VIA-4 Jurkat cells to immobilised CS-1 peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             a 2,4,6-trisubstituted s-triazine ring, where one substitution is a polyethylene glycol chain [CH3 (CH2CH2)] no-6 "no 1-150)] and the cher is either another, same, polyethylene glycol chain, or another, same, peptide chain. For examples see also AAR29631-32. These PEG derivates or their salts are useful as animal cell adhesion inhibitors, or as platelet agglutination or adhesion inhibitors. They may also be used as carcinoma metastasis inhibitors, wound healing drugs and
                                                                                                                                                                                                                                   Gaps

It may be a repeating unit of up to 10 times the sequence given. It is useful as an animal cell adhesion inhibitor or platelet aggregation/adhesion inhibitor.

The alpha-4 beta-1 (CD49d/CD29, VLA-4) cell adhesion receptor is an active participant in leukocyte trafficking functions. Binding of inflammatory cells to endothelial cells that express the CS-1 portion (AAW01703) of fibronectin on their surfaces can be inhibited by CS-1 peptidomimetic cpds. of minimal length. A minimal essential sequence for
                                                                                                                                                                                                                                                                                                                                                                       This peptide deriv. inhibits adhesion of animal cells, partic pattled aggregation. The deriv. can be used in cancer metastasis inhibitors, wound healers, immune inhibitors, platelet aggregation inhibitors or drugs for treating neuropathy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        fibronectin; high affinity, CS-1; recognition sequence; VLA-4; plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 plan-4 pl

Binding of inflammatory cells to endothelial cells that express the CS-1 portion (AAMO1703) of fibronectin on their surfaces can be inhibited by CS-1 peptidomimetic cpds. of minimal length. A minimal essential sequence for peptidomimetic cpds. of minimal length. A minimal essential sequence for beptidomimetic peptidomimetic inhibites the binding of Jurkat cells (ATCC TIB 152) to a solid phase-bound CS-1 peptide in an in vitro assay in an aq. buffer at a pH value of 7.2-7.4 to an extent that is equal to or upto about 3000-fold greater than the inhibition in the binding exhibited by AAMO1705. CS-1 mediated inflammation, e.g. asthma, rheumatoid arthritis, osteoarthritis, allograft rejection, skin
specific VLA-4 recognition of CS-1 has been identified as the tripeptide LDV. The generic peptidomimetic inhibits the binding of Jurkat cells (ATCC TIB 152) to a solid phase-bound CS-1 peptide in an in vitro assay in an ag. buffer at a pH value of 7.2-7.4 to an extent that is equal to or upto about 3000-fold greater than the inhibition in the binding exhibited by the present standard peptide sequence. CS-1 mediated inflammation, e.g. asthma, rheumatoid archritis, osteoarthritis, allograft rejection, skin inflammation or central nervous system demyelinating disease, can be treated by the peptidomimetics. See AAW01706-27 for exemplary inhibitor peptides.
                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            fibronectin; high affinity; CS-1; recognition sequence; VLA-4; alpha-4 beta-1 cell adhesion receptor; CD49d/CD29; inhibitor; leukocyte trafficking function; peptidomimetic; treatment; asthma; rheumatoid archritis; osteoarchritis; allograft rejection; skin inflammation; central nervous system demyelinating disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Inhibitor of fibronectin CS-1 peptide and VLA-4 receptor binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New peptide mimics of fibronectin CS-1 sequence - inhibit interaction of endothelial cells and VLA-4, carrying inflammatory cells, for treating or preventing asthma, arthritis etc.
                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                         100.0%; Score 23; DB,16; Length 10; 100.0%; Pred. Vascular cell adhesion molecule-1 (VCAM-1) is protein found on the surface of endothelial cells that line the interior wall of capillaries. VCAM-1 recognises and binds to the integrin alpha-4beta-1 (TAMB1) or VLAM-4 for very late antigen-4), a heterodimeric protein present on the surface of certain white blood cells. Binding of IAAB1 to VCAM-1 allows white blood cells to adhere to the capillary wall in areas where the surface of certain white blood cells in areas where the surface of certain wite capillary has been infected or damaged. Sometimes this white blood cell migration can become uncontrolled, with white blood cells flooding to the scene, causing widespread tissue damage. Cods. capable of blocking this process may be beneficial as therapeutic agents. IAAB1 also recognises the extracellular matrix glycoprotein fibronectin. One site is found in the HeplI region and is a cythin fibronectin. One site is found in the HeplI region and is a leteratively spliced type III connecting segments. CSI has the higher affinity for IAAB1 and contains the tripeptide LDV as its minimal active site. Peptides AAR95704-805 are modeled after a portion of the CSI

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Guences AAW70543 to AAW70545 represent CS-1 peptide fragments used during the course of the invention. The invention provides integrinting the course of the invention. The invention provides integrinting the course of the invention. The invention provides that comprise an integrint alpha or beta claim associated with an immunoglobulin light or heavy chain. These chimeric protein containing an integrint alpha chain and an immunoglobulin chain; the invention of the protein containing an integrinting an integrinting an integrinting an integrinting an integrinting an integrinting an integrinting an integrinting the analyst chain; or one of the two may be a light of the chain is preferably beta 1. Animal cells transformed with vectors containing the DNA coding for the above chimeric proteins can be used in the preparation of the chimeric proteins and their heterodimer complexes. The heterodimer complexes, which are useful for testing potential promoters and inhibitors of the binding of integrins to their configuration as blood platelet substitutes and hemostatics and as
                                                                                    ö
                                                                                                                                                                                                                                                                                       Integrin; alpha-4 chain; immunoglobulin; chimeric; heterodimer complex;
inhibitor; binding; ligand; blood platelet; hemostatic; diagnostic agent;
peptide that include the LDV domain presented in such a way by its novel flanking sequence to produce a potent inhibitor of IA4B1 binding.
                                                                                     Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence is used in the course of the invention. The specification describes Hepatitis drugs which contain integrin inhibitors include inhibitors as the active ingredient. These integrin inhibitors include antibodies, proteins, polypeptides, peptides, mucleic acids, saccharides, and their derivatives. They also include low molecular weight compounds capable of binding to integrins (e.g. alpha chain type with alpha 1, particularly anti-VLA-4 antibody, VLA-4 inhibiting peptides and low molecular weight VLA-4 inhibiting compounds. The products can be used for treating hepatitis.
                                                                                                                                                                                                                                                                                                                                                                                                Hepatitis drug; integrin inhibitor; integrin binding; {\tt VLA-4}; treatment; hepatitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Integrin inhibitors including antibodies, proteins, nucleic acids, saccharide(s), capable of binding to integrin(s) as active ingredient in remedies - for treating hepatitis, by inhibiting cell

                                                                                                                                                                                                                                                                                                           The present sequence represents part of a CS-1 peptide. The specification describes a cyclic CS-1 peptidommimetic inhibitor peptide, which is water soluble and inhibits the binding of Jurkat cells to a solid-phase bound peptide (AAW88057). The inhibitor peptides are useful for treating fibronectin CS-1 or sVCAM 1/VLA-4 mediated inflammation, esg. asthmá, arkhritic conditions (e.g. rheumatoid arthritis, osteoarthritis), allograft rejection, skin inflammation and demyelinating diseases of the central nervous system.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Fibronectin, FN, CS-1, endothelial cell, VLA-4 integrin, alpha-4-beta-1, CD49d/CD29; leukocyte, inflammatory cell, inflammation; cell adhesion, inhibitor; peptidomimetic; autoimmune disease; inflammatory disorder.

conditions, such as asthma, rheumatoid arthritis, osteoarthritis and allograft rejection. They may also be used to treat psoriasis and other skin inflammations, demyelinating diseases of the central nervous system (e.g., multiple sclerosis), allergies, atherosclerosis, colitis, diabetes, inflammatcory bowel disease, kidney inflammation and restenosis. Prior art inhibition of VLA-4/CS-1 interaction either involves the use of anti-VLA-4 antibodies, which can themselves induce an immune response on repeated administration, or the 25-mer CS-1 peptide, which is large and costly to make and is subject to rapid proteolytic degradation. The peptidomimetics of the invention are smaller in comparison to the CS-1 peptide and therefore less expensive to manufacture, and are resistant to proteolysis. Sequences AAY77411-Y77414 and AAY77434-Y77444 represent fragments of the CS-1 peptide to immobilised CS-1 peptide (AAY77414).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to peptidomimetic compounds (AAY77415-Y77438) capable of inhibiting the binding of the VLA-4 integrin (alpha-4-beta-1, CD494/CD29) to the CS-1 portion (25 amino acids) of a splice variant of the extracellular matrix protein fibronectin (FN). VLA-4 is expressed on the surface of leukocytes; the CS-1 FN/VLA-4 interaction plays an important role in the maturation and trafficking. VLA-4-mediated leukocyte adhesion to the CS-1 FN of endothelial cells is also a critical step in the inflammatory response. The peptidomimetics of the invention may be used to treat both chronic and acute immunoinflammatory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Virucide, human immunodeficiency virus, HIV, cytostatic, ophthalmological, vasotropic, vaccine, gene therapy, transfection, cystic fibrosis, asthma; cancer, leukaemia, glaucoma; gene vaccination, anti-sense therapy, eye disease, corneal organ transplant, integrin,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention describes transfecting (I) confluent cells or other slowly dividing or non-dividing cells that are in contact with each other, with a nucleic acid. The method comprises contacting the cells with a receptor-targeted vector comprising the nucleic acid, and an agent that transfecting the cells ding that that transfecting bronchial and lung transfection. (I) is useful for transfecting bronchial and lung cancers and viral infections e.g. human immunodeficiency virus (HIV) infection. Hamaropoietic cell transfection enables gene therapy, gene vaccination and anti-sense therapy of diseases involving haematopoietic cells, including leukaemia and bone marrow stem cell disorders.

Transfection of corneal endothelium is useful for treatment of eye disease affecting the corneal organ transplants, for e.g. in glaucoma. A gene preventing cell proliferation in blood vessel walls is introduced using an integrin targeting transfection vector complex (II) to reduce restenosis. (II) is useful for intracellular transport and delivery of anti-sense oligonuclede, which enables antiviral and cancer therapy and is effective in transporting large DNA molecules. This sequence represents a peptide that lacks the conserved RGD integrin binding amino acid sequence but binds integrins allowing the investice acid to pass into the cell, described in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Integrin binding component; polycationic nucleic acid-binding component;
                                                                                                                                                             Transfecting confluent cells with nucleic acid for gene therapy or gene vaccination, comprises contacting the cells with a receptor-targeted vector having the nucleic acid and an agent that disrupts cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      lipid component; prophylaxis; immunisation; antisense therapy; asthma; cystic fibrosis; cancer; viral infection; human immunodeficiency virus; HIV infection; vaccine; neuroblastoma; bone marrow stem cell disorder; leukaemia; adjuvant immunotherapy; eye disease; glaucoma; restenosis;

The invention relates to integrin-targetting vectors having enhanced transfection activity. The vector complex comprises a nucleic acid, an integrin binding component, a polycationic nucleic acid, binding component, a polycationic nucleic acid, binding component and a lipid component. The integrin binding component and a lipid component. The integrin binding component component and a lipid component. The integrin binding element and a spacer element. Complex component asserting in useful for transfecting ocells in vitro or in vivo with a nucleic acid, for transfecting bronchial and lung epithelium and caused in human or a non-human animal by a defect and/or a deficiency in a gene, immunisation and antisense therapy of a human or a non-human animal. It is useful for transfections for cystic fibrosis, asthma and also aracters and viral infections. For example human cancers and viral infections for example human and correct and viral infection. It is also useful as a vaccine or for therapy of neuroblascoma and the effective transfection of primary smooth muscle cells, cardiac myocytes and haematopoietic cells. The mantopoietic cells in and antisense therapy of diseases involving haematopoietic cells. Transfection of a cytokine gene may be used for adjuvant immunotherapy. Transfection of a cytokine gene may be used for adjuvant immunotherapy. Transfection of corneal endothellum is useful for treatment of eye disease affecting the cornea or corneal organ transplants, for example transfection of sessel walls is introduced using complex of the invention to reduce vessel walls is introduced using complex of the invention to reduce the integrin-binding peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             VLA-4; inhibitor; binding peptide; leucocyte adhesion; CD49d/CD29; CDR; alpha4betal integrin; VCAM-1; endothelial cell; antibody; meningitis; complementarity determining region; inflammatory brain disorder; therapy; multiple sclerosis; encephalitis; Alzheimer's disease; atherosclerosis;

This sequence is a fragment of CS-1 (AAW01703) a high affinity peptide cecognition sequence for VLA-4 within fibronectin. The alpha-4 beta-1 (CD494/CD29, VLA-4) cell adheasion receptor is an active participant in leukocyte trafficking functions. Binding of inflammatory cells to endothelial cells that express the CS-1 portion of FN on their surfaces of minimal length. A minimal essential sequence for specific VLA-4 recognition of CS-1 has been identified as the tripeptide LDV. The generic peptidomimetic inhibite the binding of Jurkat cells (ATCC TIB 152) to a solid phase-bound CS-1 peptide in an in vitro assay in an aq. buffer at a pH value of 7.2-7.4 to an extent that is equal to or upto about 3000-fold greater than the inhibition in the binding exhibited by AAW01705. Deletion mutants of the present sequence were formed and in vitro binding of the peptide CS-1 mediated inflammation, e.g. asthma, rheumatoid archritis, osteoarthritis, allograff rejection, skin inflammation or central nervous system demyelinating disease, can be treated by the peptidomimetics. See AAW01706-27 for exemplary inhibitor peptides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Cyclic CS-1 peptidomimimetic inhibitor; Jurkat cell binding; fibronectin CS-1 mediated inflammation; rheumatoid arthritis; sVCAM 1/VLA-4 mediated inflammation; asthma; arthritic condition; rheumatoid arthritis; osteoarthritis; allograft rejection;
                                                                                                                                                                                                  New peptide mimics of fibronectin CS-1 sequence - inhibit interaction of endothelial cells and VLA-4 carrying inflammatory cells, for treating or preventing asthma, arthritis etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            100.0%; Score 23; DB 16; Length 12; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                   AR892534 and AAR92235 represents VLA-4 binding peptides. VLA-4 is also known as alpha4beta1 integrin and CD49d/CD29. VLA-4 binds to the con-matrix molecule VCAM-1, which is expressed by endothelial and other cells. This sequence (and peptides designed from it) minic a short cells. This sequence in the heavy chain complementarity determining region (CDR) as of monoclonal antibodies against alpha4beta1 integrin. This sequence inhibits the adhesion of loucocytes mediated by VLA-4. It is useful for treating inflammatory brain disprders (especially multiple clerosclerosis, meningitis, encephalitis, asthma, Alzhaimer's disease, atherosclerosis, AIDS dementia, diabetes, inflammatory bowel disease, theumatoid arthritis, transplant rejection, tumour metastases and creating in sequence can also be labelled, and can then be used for in vivo or in vitro diagnosis, such as monitoring inflammatory responses, isolating leucocytes, in assays for inhibitors of VLA-4/VCAM-1 interactions and imaging sites of inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Integrin; transfection complex; integrin-binding; lipid; immunisation; antisense therapy, enzyme; therapeutic agent; immunogen; cystic fibrosis; cancer; viral infection; human immunodeficiency virus; cardiovascular;
                                                                                                                                                                   The specification describes a cyclic CS-1 peptidomimimetic inhibitor which is water soluble and inhibits the binding of Jurkat cells to a solid-phase bound peptide (AAM88057). The inhibitor peptides are useful for treating fibronectin CS-1 or sVCAM I/VIA-4 mediated inflammation, e.g. asthma, arthritic conditions (e.g. rheumatoid arthritis, oslograft rejection, skin inflammation and demyelinating diseases of the central nervous system. The present sequence appears in the specification.
                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                               Cyclic inhibitor peptide - useful for treating fibronectin CS-1 or sVCAM-1/VLA-4 mediated inflammation, e.g. asthma and arthritic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New integrin-targeting transfection complex including lipid - used to improve transfection efficiency for a very wide range of cells, useful in, e.g. antisense therapy and genetic immunisation

```

The invention relates to an integrin-targeting transfection complex. The complex comprises a nucleic acid, an integrin-binding component, a

```
polycationic nucleic acid-binding component and a lipid. The complexes are used for in vivo or in vitro transfection of cells, specifically:

(1) for treatment or prevention of disease (in humans or other animals) caused by defective or deficient genes; (ii) for immunisation; (iii) for antisense therapy, and (iv) for protein production in host cells, e.g. or enzymes, therapeutic agents, vacainating immunogens and diagnostic antisens. Typical of the diseases that can be treated or prevented are cystic fibrosis, cancer, viral infection (e.g. human immunodeficiency irus), cardiovascular disease (e.g. restenosis), leuksemia, asthma and glaucoma. Incorporation of the lipid into the complex increases transfection levels from 1-10 percent to over 50 percent. This effect is observed with all cell types tested including those that are resistant to transfection by most plasmid vectors. The complexes can carry large genes, up to 125 kb, e.g. an artificial chromosome. The present sequence represents a claimed example of an integrin-binding peptide used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Fibronectin, FN; CS-1; endothelial cell; VLA-4 integrin; alpha-4-beta-1; CD49d/CD29; leukocyte; inflammatory cell; inflammation; cell adhesion; inhibitor; peptidomimetic; autoimmune disease; inflammatory disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to peptidomimetic compounds (AAY77415-Y77438) capable of inhibiting the binding of the VLA-4 integrin (alpha-4-beta-1, 4.2 by 494/CD29) to the CS-1 portion (52 amino acids) of a splice variant of the extracellular matrix protein fibronectin (FN). VLA-4 is expressed on the surface of leukocytes; the CS-1 FN/VLA-4 interaction plays an important role in the maturation and trafficking. VLA-4-mediated leukocyte adhesion to the CS-1 FN of endothelial cells is also critical step in the inflammatory response. The peptidomimetics of the invention may be used to treat both chronic and acute immunoinflammatory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New peptidomimetic compounds used as cell surface fibronectin expressing receptor and VLA-4 inhibitors for treating inflammatory and

              allograft rejection. They may also be used to treat psoriasis and other skin inflammations, demyelinating diseases of the central nervous system (e.g., multiple sclerosis, allorgies, atherosclerosis, colitis, diabetes, inflammatory bowel disease, kidney inflammation mether restenosis. Prior art inhibition of VLA-4/CS-1 interaction either immoves the use of anti-VLA-4 antibodies, which can themselves induce an immone response on repeated administration, or the 25-mer CS-1 peptide, which is large and costly to make and is subject to rapid proteolytic comparison to the CS-1 peptide and therefore less expensive to manufacture, and are resistant to proteolysis. Sequences AAY77411-Y77414 and AAY7743-Y77444 represent fragments of the CS-1 peptide for their ability to inhibit VLA-4 Jurkat cells to immobilised CS-1 peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention describes transfecting (I) confluent cells or other slowly dividing or non-dividing cells that are in contact with each other, with a nucleic acid. The method comprises contacting the cells with a receptor-targeted vector comprising the nucleic acid, and an agent that disrupts cell-cell junctions under conditions suitable to effect
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Virucide, human immunodeficiency virus, HIV, cytostatic, ophthalmological, vasotropic, vaccine; gene therapy, transfection; cystic fibrosis; asthma; cancer; leukaemia; glaucoma; gene vaccination, anti-sense therapy; eye disease; corneal organ transplant; integrin; transfection; restenosis; alpha 4 beta 1 integrin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Transfecting confluent cells with nucleic acid for gene therapy or gene vaccination, comprises contacting the cells with a receptor-targeted vector having the nucleic acid and an agent that disrupts cell-cell

transfection. (I) is useful for transfecting bronchial and lung epithelium for gene therapy for cystic fibrosis, asthma and also various cancers and viral infections e.g. human immundeficacy virus (HIV) infections e.g. human immundeficacy virus (HIV) infection. Haematopoietic cell transfection enables gene therapy, gene vaccination and anti-sense therapy of disease involving haematopoietic cells, including leukaemia and bone marrow atem cell disorders.

Transfection of corneal endothelium is useful for treatment of eye disease affecting the cornea or corneal organ transplants, for e.g. in glacomea. Agene preventing cell proliferation in blood vessel walls is introduced using an integrin transfection in blood vessel walls is introduced using an integrin transporting transfection vector complex (II) to reduce restenosis. (II) is useful for intracellular transport and cancer therapy and is effective in transporting large DNA molecules. This sequence represents a peptide that lacks the conserved RGD annot call sequence and cysteine residues for cyclisation, but can bind to integrins to allow the nucleic acid to pass into the cell, described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Integrin binding component; polycationic nucleic acid-binding component; lipid component; prophylaxis; immunisation; antisense therapy; asthma; cystic fibrosis; cancer; viral infection; human immunodeficiency virus; HIV infection; vaccine; neuroblastoma; bone marrow stem cell disorder; leukaemia; adjuvant immunotherapy; eye disease; glaucoma; restenosis;

```

This represents a CS-1 peptide sequence. The invention provides connegrin-immunoglobulin chimeric protein heterodimer complexes that comprise an integrin alpha or beta chain associated with an immunoglobulin light or heavy chain. These chimeric proteins form containing an integrin batticular with a chimeric protein containing an integrin beta chain and an immunoglobulin chain in each case may be a heavy chain, or one of the two may be a light chain. The integrin alpha chain is preferably alpha 4 cor alpha 2 and the integrin alpha chain is preferably beta 1. Animal cells two may be a light chain. The integrin alpha chain is preferably alpha 4 cor alpha 2 and the integrin beta chain is preferably beta 1. Animal cells transformed with vectors containing the DNA coding for the above chimeric proteins can be used in the preparation of the chimeric proteins and their theterodimer complexes. The heterodimer complexes, which are useful for testing potential promoters and inhibitors of the binding of integrins to their ligands, function as blood platelet substitutes and hemostatics and as diagnostic agents.

an integrin binding component, a polycationic nucleic acid-binding component and a lipid component. The integrin binding component comprises an integrin-binding element and a spacer element. Complex of the invention is useful for transfecting cells in vitro or in vivo with a nucleic acid, for treatment or prophylaxis of a condition caused in human or a non-human animal by a defect and/or a deficiency in a gene, immunisation and antisense therapy of a human or a non-human animal. It is useful for transfecting bronchial and lung epithelium and corneal endothelium for gene therapy for cystic fibrosis, asthma and also various cancers and viral infections. The also useful as a vaccine corneal endothelium for gene therapy for cystic fibrosis, asthma and immunodeficiency virus (HIV) infection. It is also useful as a vaccine or for therapy of neuroblastoma and the effective transfection of primary smooth muscle cells, cardiac myocytes and haematopoietic cells. Heematopoietic cell transfection enables gene therapy, gene vaccination and antisense therapy of diseases involving haematopoietic cells. Including leukaemia and bone marrow stem cell disorders, for example transfection of corneal endothelium is useful for treatment of eye disease affecting the cornea or corneal organ transplants, for example in glaucoma. A gene that prevents proliferation of cells in blood vessel walls is introduced using complex of the invention to reduce restenosis. The present sequence is integrin-binding peptide

cetterosis. The present sequence is integrin-binding peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Integrin; alpha-4 chain; immunoglobulin; chimeric; heterodimer complex;

The present sequence is used in the course of the invention. The specification describes Hepatitis drugs which contain integrin inhibitors as the active ingredient. These integrin inhibitors include antibodies, proteins, polypeptides, peptides, nucleic acids, saccharides, and their derivatives. They also include low molecular weight compounds alpha 2, etc., or beta chain type with beta 1, particularly anti-VLA-4 antibody, VLA-4 inhibiting peptides and low molecular weight VLA-4 inhibiting compounds. The products can be used
                                                                                    Hepatitis drug; integrin inhibitor; integrin binding; VLA-4; treatment;
                                                                                                                                                                                                                                                                                                                                                                                    active

as very late antigen-4 (VLA-4) antagonists to treat diseases mediated by cell adhesion. (I) has antiasthmatic, antiallergic, antifilammatory, neuroprotective and antiarteriosclerotic activities. (I) are used to prevent the action of VLA-4 in prevention and treatment of diseases mediated by cell adhesion selected from asthma, allergic rhinitis, multiple sclerosis, atherosclerosis and inflammatory bowel disease. The present sequence represents a synthetic CS-1 peptide which is used in an example from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Very late antigen-4; VLA-4; cell adhesion inhibitor; CD49d/CD29; alpha4/beta7 integrin; cyclic amidine derivative, rhinitis; asthma; multiple sclerosis; atherosclerosis; bowel disease; inflammation; nephritis; AIDS-related dementia; acquired immunodeficiency syndrome; diabetes; conjunctivitis; Alzheimer & disease; acrtic stenosis; myeloma; contact dermal hypersensitivit; ulcerative colitis; Crohn's disease; lung disease; cancer; viral infection; meningitis; pulmonary fibrosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes heterocyclic amides (I) which are used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Use of new and known heterocyclic amides as VLA-4 antagonists to treat and prevent disorders mediated by cell adhesion e.g. asthma, allergic rhinitis, multiple sclerosis, atherosclerosis and inflammatory bowel
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  myocarditis; organ transplantation; psoriasis; restenosis; retinitis;
arthritis; stroke; tumour metastasis; uveititis; vascular occlusion;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Very late antigen-4 (VLA-4) dependent adhesion related peptide, CS-1.

                                                                                                                  ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        are cyclised via disulphide or amide bonds. The peptides are very late antigen-4 (VLA-4) adhesion inhibitors. They are useful for treating inflammation, especially allergic inflammation and hepatitis, autoimmune disease, rejection reactions following organ transplants, type I diabetes, Crohn's disease, post-surgical restenosis and arteriosclerosis. The present sequence is used in the course of
                                                                                                                                                                                                                                                                                                                                                                                                                                    Cyclic hexapeptide; very late antigen-4; VLA-4; adhesion inhibitor; inflammation; allergic inflammation; hepatitis; autoimmune disease; rejection reaction; organ transplant; type I diabetes; Crohn's disease; post-surgical restenosis; arteriosclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

This invention relates to the use of a peptide, which is an immunogenic portion derived from a dnaJ heat shock protein (hsp) in modulating an immunome response in a subject. The peptides of the invention may have immunomedulatory, cytostatic, antiinflammatory, antibacterial or antiarthritic properties and can stimulate expression of interleukins, tumour necrosis factor and transforming growth factor beta. The immunogenic peptide is useful for modulating (i.e. augmenting/inducing or reducing/inhibiting) an immune response in a subject having an immunological disorder (e.g. autoimmune disease such as arthritis or articular juvenile idiopathic arthritis), an infectious disease, an inflammatory bowel disease or cancer. The immunogenic peptide of the invention is also useful for modulating immunogenic peptide of the invention is abbject. The immunogenic peptide of the invention a subject. The immunogenic peptide of the above-mentioned diseases in mammals, e.g. cat, dog, horse, farm animal (e.g. ovine, bovine or porcine) or human. In general, the peptide is useful in methods involving mucosal colerisation, DNA vaccination, anergy induction or active immunogenic peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                          treating immunological disorder in subjects such as humans, e.g.
autoimmune disease (e.g. arthritis), infectious disease, inflammatory
                                                                                                                                                                                                                                                                                                                                                                  New immunomodulatory peptides from heat shock proteins, useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               100.0%; Score 23; DB 23; Length 15; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention describes novel substituted cyclic amidine derivatives (I).

(I) are useful for the prevention or treatment of disease or disorders mediated by cell adhesion in a mammal e.g. asthma, allergic rhinitis, multiple sclerosis, atherosclerosis, inflammatory bowel disease or inflammation e.g. acute respiratory distress syndrome (ARDS).

AIDS-related dementia, allergic conjunctivitis, Alzheimer's disease, actic stenosis, autologous bone marrow transplantation, certain types of toxic and immune based nephritis, contact dermal hypersensitivity, ulcerative collitis, Crohn's disease, inflammatory lung disease, inflammatory sequelae of viral infections, meningitis, multiple myeloma, myocarditis, organ transplantation, psoriaais, pulmonary fibrosis, restenosis, retinitis, rheumatoid arthritis, septic arthritis, stroke, concert, tumour metastasis, uveititis, type I diabetes and vascular occlusion following angioplasty. The compound inhibits cell adhesion processes including cell activation, migration, proliferation and the inhibition of very late antigen-4 (VLA-4, CD49d/CD29 or alpha4/beta7 integrin) dependent adhesion.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

(L'1) - d = same or different [1],

(L'1-L'4 = same or different linkers,

a f = 0 or 1, provided at least one of a and b = 1,

L'1-L'4 = same or different linkers,

a recleic acid that encodes (Ia), an expression vector containing the

nucleic acid that encodes (Ia), an expression or ector containing the

nucleic acid, host cells containing the vector, producing at least one

pharmaceutically active compound (B) by covalently linking at least one

pharmaceutically active compound (B) by covalently linking at least one

C domain to at least one amino acid sequence of a selected randomized

(I) and any of six laminin-related peptides (Ib). The compositions are

used prophylactically and therapeutically in the same way as (I), e.g. to

inhibit platelet aggregation or angiogenesis (tumours), or to treat

inflammation and autoimmune diseases (e.g. rheumatcid arthritis) and many

different forms of osteoporosis, also for diagnosis. Attaching the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a composition comprising an integrin/adhesion antagonistic peptide (I) and a vehicle e.g. IgG Fc. The peptides are based on laminin or saw-scaled viper echistatin and target integrin, selectin or vinculin. Also included are compounds of formula (Ia) and their multimers (\chi^2)_{-} a +F^1-(\chi^2)_{-} b where,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Composition comprising integrin or adhesion antagonistic peptide and vehicle, useful for treating or preventing platelet aggregation, has a longer half-life than free peptide

                                                                                                                                                                                                           One of 1 or 2 of these chains are attached via the N- or C-terminal to a 2,46-trisubstituted s-triazine ring, where one substitution is a polyethylene glycol chain [CH3(OCH2CH2)n-O- (in=1-150)] and the other is either another, same, polyechylene glycol chain, or another, same, peptide chain. These PEG derivates or their salts are useful as animal cell adhesion inhibitors, or as platelet agglutination or adhesion inhibitors. They may also be used as carcinoma metastasis inhibitors, wound healing drugs and immunoregulators.
                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This peptide deriv. inhibits adhesion of animal cells, partic platelet aggregation. The deriv. can be used in cancer metastasis inhibitors, wound healers, immune inhibitors, platelet aggregation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Peptide deriv., for cancer metastasis inhibitor - useful as wound healer, immune- and platelet aggregation inhibitor and neuropathy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          platelet aggregation; cell adhesion; cancer metastasis inhibitor; wound healing; immune inhibitor; neuropathy drug.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a composition comprising an integrin/adhesion antagonistic peptide (I) and a vehicle e.g. IgG Fc. The peptides are based on laminin or saw-scaled viper echistatin and target integrin selectin or vinculin. Also included are compounds of formula (Ia) and their multimers (X^2)_a - F^2 - (X^2)_b where;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Composition comprising integrin or adhesion antagonistic peptide and vehicle, useful for treating or preventing platelet aggregation, has a longer half-life than free peptide
                                                                                    Gaps
                                                                                                                                                                                                                                                             IgG Fc, anticoagulant, thrombolytic, cytostatic, antagonist, antiinflammatory; immunosuppressive; osteopathic; antagonist, laminin; saw-scaled viper; echistatin; integrin; selectin; vinculin; platelet aggregation; anglogenesis; tumour; inflammation; autoimmune disease; rheumatoid arthritis; osteoporosis.
vehicle (especially Fc domain) to (I) increases the half-life (frare normally degraded very quickly in vivo). The present sequence is an antagonist peptide of the invention.
                                                                                    ö

ö
inflammation and autoimmune diseases (e.g. rheumatoid arthritis) and many different forms of osteoporosis, also for diagnosis. Attaching the vehicle (especially Fc domain) to (I) increases the half-life (free (I) are normally degraded very quickly in vivo). The present sequence is an antagonist peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a composition comprising an integrin/adhesion antagonistic peptide (I) and a vehicle e.g. IgG Fc. The peptides are based on laminin or saw-scaled viper echistatin and target integrin, selectin or vinculin.Also incoluded are compounds of formula (Ia) and their miltimers (X'1)_a-F'1-(X^2)_b where,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         a-f = 0 or 1, provided at least one of a and b = 1, a nucleic acid that encodes (1a), an expression vector containing the nucleic acid, host cells containing the vector, producing a pharmaceutically active compound (B) by covalently linking at least one Fc domain to at least one amino acid sequence of a selected randomized (I) and any of six laminin-related peptides (Ib). The compositions are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ø

used prophylactically and therapeutically in the same way as (I), e.g. to inhibit platelet aggregation or angiogenesis (tumours), or to treat inflammation and autoimmune diseases (e.g. rheumatoid arthritis) and different forms of osteoporosis, also for diagnosis. Attaching the vehicle (sepecially FC domain) to (I) increases the half-life (free (I) are normally degraded very quickly in vivo). The present sequence is an antagonist peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The peptide is an example of a cell adhesion polypeptide contg. the amino sequence X-Asp-Y-(A)n-Phe, where X and Y = Ala, Leu, Ile or Val. A= any amino acid and n= 3-10. At least a subsequence of the polypeptide is adherent for MoLT-4 human lymphoblastic leukaemia, A375-SM human metastatic melanoma or H1080 human fibrosarcoma cells. The call adhesion peptides are used to modify or control the adhesive properties of cells, e.g. in treatment of inflammatory conditions such as rheumatoid arthritis, asthma, sepsis, graft rejection, inflammatory bowel disease, reperfusion of cardiac tissue after myocardial infarction, and coagulatory disorders. They are selective antagonists of cell adhesion, e.g. they promote adhesion of the speccified cells but inhibit adhesion to the natural adhesion
                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 6..8

                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The peptide is an example of a cell adhesion polypeptide contg. the amino sequence X-Asp-Y-(A)n-Phe, where X and Y = Ala, Leu, Ile or Val, As any amino acid and n= 3-10. At least a subsequence of the polypeptide is adherent for MOLT-4 human lymphoblastic leukaemia, A375-SM human metastatic melanoma or H1080 human fibrosarcoma cells. The cell adhesion peptides are used to modify or control the adhesive properties of cells, e.g. in treatment of inflammatory conditions such as rheumatoid arthritis, asthma, sepsis, graft rejection, inflammatory bowel disease, reperfusion of cardiac tissue after myocardial infarction, and coagulatory disorders. They are selective antagonists of cell adhesion, e.g. they promote adhesion of the speccified cells but inhibit adhesion to the natural adhesion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gapa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              MOLT-4; human; lymphoblastic leukaemia; A375-SM; metastatic; melanoma; H1080; fibrosarcoma; LDV; LDL; IDA; inflammatory disease; rheumatoid arthritis; asthma; sepsis; graft rejection; reperfusion.

which is used in an example from the present invention. The present invention describes a chimeric adenovirus fibre protein (AFP) contraining a constrained non-native amino acid sequence. The non-native amino acid sequence. The non-native amino acid sequence allows the chimeric fibre (or a vector comprising the chimeric fibre) to more efficiently bind to and enter cells. The products can be used for gene therapy, for treating cancer, e.g. melanoma, glioma and lung cancers as well as genetic disorders, e.g. cystic fibrosis, haemophilia and muscular dystrophy as well as pathogenic infections, e.g. HIV, tuberculosis and hepatitis and also for heart disease, to e.g. prevent restenosis following angioplasty or to promote angiogenesis to reperfuse necrotic tissue, and in autoimmune disorders, e.g. Crohn's disease, colitis, rheumatoid arthritis, and Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence represents an alpha4 integrins targeting sequence, which is used in an example from the properties of the second sequence.
                                                                             Chimeric; adenovirus; fiber protein; binding; targeting; coat protein; constrained peptide motif; gene therapy; cancer; heart disease; autoimmune disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Immunogenic; conjugated polypeptide; herpes simplex virus; HSV; ICP4; immunomodulatory; T cell; immunogen; vaccine; ICP27; glycoprotein B; ribonucleotide reductase; ICP34.5; glycoprotein E; glycoprotein F; immune response; genetic immunisation.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence represents a specifically claimed non-native amino acid sequence from a chimeric adenovirus fibre protein (AFP) of the present invention. The non-native amino acid sequence allows the chimeric fibre (or a vector comprising the chimeric fibre) to more efficiently bind to and enter cells. The products can be used for gene therapy. For trearing cancer, e.g. melanoma, glioma and lung cancers as well as genetic disorders, e.g. cystic fibrosis, haemophilia and muscular dystrophy as well as pathogenic infections, e.g. HIV, tuberculosis and hepatitis and also for heart disease, to e.g. prevent restenosis following angioplasty or to promote angiogenesis to reperfuse necrotic tissue, and in autofimmune disorders, e.g. Crohn's disease, colitis, rheumatoid arthritis, and Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

The invention provides immunogenic conjugated polypeptides which comprise a herpes simplex virus peptide (HSV) linked to an immunomodulatory peptide and which promote binding to T cells. The novel immunogenic conjugated polypeptides are effective as an immunogen in a vaccine for treatment or prevention of infection by HSV and are represented by the formula Pl-x-P2 or P2-x-P1; where Pl = a HSV specific antigenic peptide form a protein of HSV type lo or type 2, selected from ICP27, glycoprotein E. ribonucleotide reductase, ICP4, ICP34-S, glycoprotein B and CC glycoprotein F; P2 = an immunomodulatory peptide which is a portion of an immunoprotein which promotes binding to a class of subclass of T cells and which directs a predominantly TH1 type immune response to the peptide CP is and a covalent bond or a clasavable or non-cleavable peptide CP in and x = a covalent bond or a cleavable or non-cleavable peptide CP in an urmula group. The conjugated polypeptides can elicit an immune response for neuralizing HSV and killing HSV infected cells. They can be used for the polypeptide can be used for genetic immunization. They can also be the presence of infection, active or latent, in an individual by HSV by mixing T cells from the individual with the polypeptide and detecting a reaction between the T cells and the CSC polypeptide.
                                                                                                                                                                                                                                                                                                           New immunogenic conjugated polypeptides
                                                                                                                                                                                                                                                                                                                                                    Example 1; Page 33; 69pp; English.
